Ocean reserve to try to halt decimation of world fish stock

TANIA WATERHOUSE

If the croat and terrifying fact that global fisheries are killing most of the life in the oceans is to be believed, then theChunk Island in the Indian

Ocean reserve to try to decimate of world fish stock

WORLD'S FLAMINGOS ON THE BEACH

HELEN BAMFORD

So I ask you: what is the most important thing you could do towards stopping overfishing and protecting the biodiversity of our oceans? And if you have the chance to step on the Chunk Island, how can you help to make sure thatChunk Island is protected for future generations?

The Chagos Archipelago is a group of islands and islets in the Indian Ocean, approximately 4000 km south of India. The islands are home to a unique and diverse ecosystem, including the world's largest colonies of red-footed boobies and red-footed cormorants. The Chagos Archipelago is also home to a large number of other species, including birds, reptiles, and mammals.

The Chagos Archipelago is a World Heritage Site, and is protected by the United Nations. Despite these protections, the Chagos Archipelago is still being exploited by the United States military, who use the islands for military purposes.

I ask you: what can you do to help protect the Chagos Archipelago and other marine ecosystems around the world? And if you have the chance to step on the Chunk Island, how can you help to make sure that the islands are protected for future generations?
